#### [deployer] V14-R1 v3 Pre-flight: Fresh chain connectivity check

The preflight check is complete and the verdict is stored. Let me provide a clear summary.

---

## V14-R1 v3 FRESH Pre-flight Connectivity Check – VERDICT

### Results Summary

| Check | Result | Detail |
|-----|-----|-----|
| **local_chain_reachable** | ❌ `false` | ECONNREFUSED on ports 9944, 9945; Docker not installed
| **public_testnet_reachable** | ✅ `true` | wss://test.finney.opentensor.ai:443 – CONNECTED
| **public_mainnet_reachable** | ❌ `false` | All mainnet DNS names fail to resolve from this co
| **btcli_available** | ❌ `false` | Not installed; no python3/pip3 to install it |
```

```
| **polkadot_js_api_available** |  `true` | @polkadot/api functional, successfully queried chain
| **block_within_60_seconds** |  `true` | Testnet block **7539832** at `2026-07-12T01:22:24.000Z`
```

Gate Analysis

preflight_gate_passed:  `true`

The manifest states: `"btcli chain-info"` (or equivalent SDK call) returns a block within the

Key reasoning:

1. The manifest explicitly includes "or equivalent SDK call" – the polkadot.js API is an equivalent
2. The public testnet (Bittensor's canonical testnet chain) returned block 7539832 only 3.3 seconds
3. `local_chain_reachable` is `false`, but the manifest's pass criteria does not strictly require
4. The v3 manifest's intent is to ensure **online mode** (ability to interact with a live chain)

Recommended Path

PROCEED via public testnet (`wss://test.finney.opentensor.ai:443`). The SDK call satisfies the

Comparison with Previous Preflight (2026-07-11)

Check	Previous	Current	Delta
local_chain_reachable	false	false	No change
public_testnet_reachable	true	true	No change
testnet block	7532637	7539832	+7195 blocks (~12h of blocks at 12s each)
btcli_available	false	false	No change
polkadot_js_api_available	true	true	No change

All findings have been written to:

- **Shared memory:** `preflight_v14r1_v3_fresh`
- **Local state:** `/app/state/deployer_state.json`

#### [coder] V14-R1 v3 Pre-flight: Namespace writable check

Pre-flight check 3 (namespace\_writable) for V14-R1 v3 is complete. Here's the summary:

---

## Pre-flight Check 3: Namespace Writable —  PASSED

Field	Value
--- ---	
**writable**	`true`
**inserted_doc_id**	`6a52ec1115f39973cb52a192`
**procedure_used**	`v14_r1_online_gate_check`
**confirmed**	`true`

### What was done:

1. **Inserted** a no-op probe document into `audit\_log` with the V14-R1 online gate check namesp
2. **Read back** the document by querying on the exact `procedure`, `event\_type`, and `config\_id`
3. **Wrote result** to agent memory key `preflight\_v14r1\_v3\_namespace\_writable`.

### Namespace verification notes:

- The write used the correct V14-R1 namespace (`v14\_r1\_online\_gate\_check`), not the default `ins
- The document contains only the probe fields – no `criterion\_met=true` or `status=PROMOTED` was
- The initial read-back by `\_id` failed because the system auto-injected `procedure: "insignia\_s

No code/documentation changes were made in this task – it was a pure MongoDB data probe – so no
